Genes and Common Diseases

Genetics in Modern Medicine

Edited by Alan Wright

MRC Human Genetics Unit, Edinburgh

and Nicholas Hastie

MRC Human Genetics Unit, Edinburgh

The aim of this book is to present an up-to-date view of the role of genetics in modern medicine, reflecting the strengths and limitations of a genetic perspective. The current shift in emphasis from the study of rare single gene disorders to common diseases brings genetics into every aspect of modern medicine. The book is in two parts, commencing with the principles underlying the genetic analysis of common diseases. The second section presents a more systematic survey of common diseases in which molecular insights into common disease mechanisms are discussed.

- Written by leading experts in genetics at a level that the practising clinician can understand
- Introductory sections explain the basics of genetics and molecular medicine, setting the scene for the disease chapters in the following section
- Wide range of clinical disorders covered and clear illustrations which help explain complex genetic concepts

This new edition increases our understanding of risk factors and prevention strategies. New material covers all the most recent studies on balance, vision, neurophysiology, reflex, syncope, vitamin D, cataract surgery and exercise. Clinicians and health professionals working in aged care settings will find it an invaluable update.

'I have nothing but praise for this monograph. The Australian authors – a physiologist, a physiotherapist and a lecturer in foot mechanics and gerontology – recognized that textbooks have dealt with falls superficially and that no-one had methodically analysed and interpreted the published work. They write elegantly and apply academic rigour to the data, highlighting the gaps and uncertainties in our knowledge and generously providing many research ideas for readers to pursue.'

Rethinking Informed Consent in Bioethics

Neil C. Manson

Lancaster University

and Onora O'Neill

University of Cambridge

Rethinking Informed Consent in Bioethics offers a coherent, wide-ranging and practical account of the role of consent in biomedicine which will be valuable to readers working in a range of areas in bioethics, medicine and law.

'In this important book, Manson and O'Neill propose a new way of thinking about informed consent – one emphasising the importance of norms appropriate for successful communication such as intelligibility, relevance, accuracy and honesty. This is a significant, timely and internationally relevant contribution to the bioethics literature. It should be essential reading for anyone interested in the ethics of medical research and treatment and in particular for anyone involved in the development of ethics policy.'

Contemporary Issues in Cancer Imaging Series

Series Editors: Professor Rodney Reznek

St Bartholomew's Hospital

Professor Janet E. Husband

Royal Marsden Hospital

Imaging is pivotal in all aspects of the management of patients with cancer; all members of the multidisciplinary team managing the cancer patient should understand the potential applications, limitations and advantages of imaging techniques, and the radiologist should have sufficient knowledge of the pathology, clinical background, therapeutic options and prognostic indicators of different tumours to understand the significance of imaging findings.

Each volume in *Contemporary Issues in Cancer Imaging* will be dedicated to a single tumour site and edited by recognised guest expert editors. The series will bring together expertise from radiologists, oncologists, pathologists, surgeons, basic scientists and others to not only promote the understanding and rational application of modern imaging but also help in the overall management of patients with cancer.

MRI from Picture to Proton presents the basics of MR practice and theory in a unique way: backwards! The subject is approached just as a new MR practitioner would encounter MRI: starting from the images, equipment and scanning protocols, rather than pages of physics theory.

'I feel this is one of the best written and comprehensive MR texts available for those new to MRI as well as those with years of MR experience under their belts. Authors who are clearly passionate about MR have written this book and they wish to share this passion with the rest of us ... the result is a book that I see being an essential piece of reference material to all MR practitioners.'

Insight in Psychiatry

Ivana Marková
University of Hull

Questions concerning the nature of insight in patients with mental illness have long interested clinicians. To what extent can patients understand their disorder? Can insight predict problems? Is impaired insight determined by the illness alone? This book examines the problems and presents a new model for understanding insight.

'Dr Marková nicely shows how the differentiation between awareness and insight provides a means of understanding the way in which different clinical phenomena relating to insight are obtained and, furthermore, helps to identify some of the specific ways in which such phenomena may be different. ... this is a well-written and well-argued book that provides new insights into the ways in which it should be understood in order to capture more accurately its clinical significance. We highly recommend the book not only to those who are interested or involved in the topic but also to any practitioner in the field of mental health.'
